

THE CAR – DISMANTLER ATTACHMENT.

With the Car - Dismantler you can get rid of any type of car faster and cheaper. Due to the many extra options that our Attachment has, it is relatively easy to separate the different parts from each other. Below is an overview of the options that are fitted as standard to the equipment.

The undercarriage features two strong arms that make it easy to clamp a car by allowing the arms to move in and out as well as up and down. The arms are equipped with extra tools that make demolishing and separating even easier.

A wiring stripper is mounted at the end of both arms. Pulling the harness through with the clamp will strip the cables of the thickest pieces of plastic and other debris.

To clamp the wreck on the tires, round discs have been mounted that hold the axle firmly and securely. This allows the wreck to be emptied accurately.

To create extra breakout force, the arms are equipped with two breaking tines. These are easy to replace for new ones to always work with the right sharpness.

These teeth are often used for separating engine blocks and their heads. Because the arms can spread and close, a large breaking force is created with which an engine block is cracked with ease.

Both arms can be moved up and down by hydraulically powered cylinders. At the highest level, the arms will be 230 cm (7.5 ft) of the ground, allowing you to easily raise your arms above the wreck. By then moving the arms downwards, the wreck cannot move in any direction and the parts that are firmly attached can be dismantled with ease.

By spreading or closing the arms by hydraulic cylinders, a good break force is created in addition to an enormous clamping force. Because the arms

can be spread by approximately 230 cm (7.5 Ft), there is enough space between the arms to work with the clamp. In addition to the clamping force, the arms provide enough stability to expertly clear the wreck while still providing the necessary comfort for the operator.

The clamp is equipped with a 360-degree turn angle with which every part can be reached without difficulty. The pointed tip makes precise work easy and very powerful. The clamp is equipped with the same cylinder as that of the arms, which gives us a unique concept with many possibilities that result in a profitable demolition of end-of-life vehicles.
